

IN THE CLAIMS

Please amend the claims to read as follows:

Listing of Claims

1-5. (Canceled).

6. (Currently Amended) ~~[[The]]~~ A communication apparatus according to claim 2, for executing a wired communication using a plurality of sub carriers, said apparatus comprising:

a transmission signal generator for generating first and second transmission signals;

a transmitter for transmitting the first transmission signal generated by the transmission signal generator; and

a transmission signal controller for controlling a transmission power of the second transmission signal generated by the transmission signal generator based on a radiation power in a transmission line in correspondence with a frequency of the sub carrier of the first transmission signal generated by the transmission signal generator,

wherein the transmitter transmits the second transmission signal the transmission power of which is controlled by the transmission signal controller via the transmission line,

wherein the transmission signal controller reduces the transmission power of the sub carrier of the frequency in which the radiation power exceeds a predetermined value, and

wherein the transmission signal controller intermittently changes the transmission power of the sub carrier of the frequency in which the radiation power exceeds the predetermined value.

7. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the transmission signal controller selects a modulation system of the sub carrier based on a indicating the radiation power from the transmission line.

8. (Original) The communication apparatus according to claim 7, wherein the transmission signal controller changes the modulation system of the sub carrier of the frequency in which the radiation power exceeds the predetermined value to a modulation system having a relatively low communication rate.

9. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the transmission line utilizes a pair of lines, and the transmission signal generator generates the first and second transmission signals transmitted to the pair of lines for each sub carrier and each transmission line based on a transmission data and the radiation power.

10. (Previously Presented) The communication apparatus according to claim 9, wherein the transmission signal generator generates a differential component of the second transmission signal based on the transmission data and generates a common component of the second transmission signal based on the radiation power.

11. (Original) The communication apparatus according to claim 10, wherein the common component is generated such that the radiation power is reduced.

12. (Original) The communication apparatus according to claim 11, wherein the radiation power includes a radiation power component when a predetermined test signal is transmitted to the transmission line as the differential signal and a radiation power component when the predetermined test signal is transmitted to the transmission line as a common mode signal.

13. (Currently Amended) ~~[[The]]~~ A communication apparatus according to claim 9, for executing a wired communication using a plurality of sub carriers, said apparatus comprising:
a transmission signal generator for generating first and second transmission signals;
a transmitter for transmitting the first transmission signal generated by the transmission signal generator; and

a transmission signal controller for controlling a transmission power of the second transmission signal generated by the transmission signal generator based on a radiation power in a transmission line in correspondence with a frequency of the sub carrier of the first transmission signal generated by the transmission signal generator,

wherein the transmitter transmits the second transmission signal the transmission power of which is controlled by the transmission signal controller via the transmission line,

wherein the transmission signal controller reduces the transmission power of the sub carrier of the frequency in which the radiation power exceeds a predetermined value,

wherein the transmission line utilizes a pair of lines, and the transmission signal generator generates the first and second transmission signals transmitted to the pair of lines for each sub carrier and each transmission line based on a transmission data and the radiation power,

wherein the transmission signal controller includes a time-frequency transformer for

converting a radiation power signal indicating the radiation power into a frequency component, a comparator for comparing respectively of the frequency component with a predetermined comparison value and outputting a comparison result, a coefficient generator for generating a predetermined coefficient in accordance with an output of the comparator, and a parallel to serial converter for converting the coefficient outputted from the coefficient generator in parallel into a series coefficient data; and

wherein the transmission signal generator includes a first data converter and a second data converter for outputting a first transmission original data for providing the second transmission signal transmitted to one of the pair of lines and outputting a second transmission original data for providing the second transmission signal transmitted to other of the pair of lines by converting the transmission data based on the series coefficient data.

14. (Previously Presented) The communication apparatus according to claim 13, wherein the common component of the second transmission signal based on respectively of the first transmission original data and the second transmission original data is a signal for canceling the radiation power signal.

15. (Currently Amended) The communication apparatus according to claim [[1]] 6, further comprising:

a radiation power detector for directly detecting the radiation power.

16. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the wired transmission utilizes a pair of lines, further comprising:

a radiation power detector for indirectly detecting a signal of the radiation power by utilizing signals transmitted through the pair of lines.

17. (Original) The communication apparatus according to claim 16, wherein the radiation power detector detects an unbalance component of the signals transmitted through the pair of lines.

18. (Original) The communication apparatus according to claim 15, further comprising:

a radiation power transmitter for transmitting the radiation power signal indicating the radiation power detected by the radiation power detector to other communication apparatus.

19. (Original) The communication apparatus according to claim 15, further comprising:

a power control signal transmitter for transmitting a power control signal calculated based on the detected radiation power for controlling the transmission power of the sub carrier to other communication apparatus.

20. (Currently Amended) The communication apparatus according to claim [[1]] 6, further comprising:

a radiation power receiver for receiving a radiation power signal indicating the radiation power from outside.

21. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the transmission signal controller intermittently makes the transmission powers of all of the sub carriers constant and utilizes the radiation power signal at that occasion for controlling the second transmission signal.

22. (Currently Amended l) The communication apparatus according to claim [[1]] 6, wherein the radiation power signal indicating the radiation power is acquired only once in starting communication.

23. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the radiation power signal indicating the radiation power is acquired periodically.

24. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the transmission line is a power line.

25. (Currently Amended) The communication apparatus according to claim [[1]] 6, wherein the wired transmission is a transmission of an OFDM system.

26. (Original) The communication apparatus according to claim 25, wherein the wired transmission is the transmission of the OFDM system using a wavelet transformation.

27. (Currently Amended) A communication system comprising a plurality of communication apparatus connected via a wired transmission line, wherein one communication apparatus out of the plurality of communication apparatus is the communication apparatus according to claim [[1]] 6 for transmitting the detected radiation power signal indicating the detected radiation power to all of remaining communication apparatus out of the plurality of communication apparatus,

wherein the one communication apparatus further includes a radiation power detector for directly detecting the radiation power and a radiation power transmitter for transmitting the radiation power signal indicating the radiation power detected by the radiation power detector to other communication apparatus,

wherein the remaining communication apparatus are the communication apparatus according to claim [[1]] 6 for controlling the transmission power of the sub carrier based on the radiation power signal received from the one communication apparatus, and

wherein the remaining communication apparatus further includes a radiation power receiver for receiving a radiation power signal indicating the radiation power from outside.

28. (Original) A communication system comprising a plurality of communication apparatus connected via a wired transmission line, wherein one communication apparatus out of the plurality of communication apparatus is the communication apparatus according to claim 19 for transmitting the power control signal to all of remaining communication apparatus out of the plurality of communication apparatus; and

wherein the remaining communication apparatus control the transmission power of the sub carrier based on the transmission power control signal received from the one communication apparatus.

29. (Currently Amended) A communication method for executing a wired transmission by using a plurality of sub carriers, said method comprising:

(a) generating first and second transmission signals;

(b) transmitting the first transmission signal from a transmitter;

(c) controlling a transmission power of the second transmission signal based on a radiation power in a transmission line in correspondence with a frequency of the sub carrier of the first transmission signal; and

(d) transmitting the second transmission signal the transmission power of which is controlled via the transmission line, wherein:

step (b) further comprises transmitting the second transmission signal,

step (c) further comprises (i) controlling the transmission power of the second transmission signal via the transmission line, (ii) reducing the transmission power of the sub carrier of the frequency in which the radiation power exceeds a predetermined value, and (iii) intermittently changing the transmission power of the sub carrier of the frequency in which the radiation power exceeds the predetermined value.

30. (Currently Amended) The communication apparatus according to claim ~~[[1]]~~ 6, wherein the first and second transmission signals includes data which is normally transmitted via the transmission line.

31. (Canceled)
